As part of its technical and digital services package, the National Center of Meteorology (NCM) provides the "Anwa" application, which is an advanced digital platform that aims to facilitate access to weather and weather phenomena data, and enable various segments of society to follow up on the weather situation around the clock.

The application reflects the center's endeavor to continue digital transformation and employ modern technologies, as it provides detailed up-to-date information on temperatures, wind activity, rain opportunities, and real-time alerts of weather phenomena, through an easy and integrated user interface.

Anwa is distinguished by providing content in 9 languages, to meet the needs of citizens, residents and visitors from various segments, which contributes to raising awareness of weather changes and enhancing community safety.

The app also supports data visualization using artificial intelligence and interactive maps, and provides the ability to receive instant notifications based on geographical location, making it an effective tool for individuals and stakeholders to prepare and make the right decision at the right time.

The "Anwa" application is part of the continuous efforts made by the National Center of Meteorology to upgrade and expand the scope of its digital services, in line with the goals of the Kingdom's Vision 2030 to enhance smart government services.

The center provides the app through the Apple Store and Google Play stores, to benefit from its advanced services in following the latest weather and weather phenomena and their associated effects.
